

**In the name of God**

**Hello dear guests dear ambassadors and dear cultural attaches; students and professors from Iran and other countries.**

**As you know, Tehran University of Medical Sciences and University of Tehran, in the form of a higher education center with about 180 years of history, is the oldest modern higher education center in Iran. However, looking at the history of Iran, we can see that we had older universities before, and Jundishapur, the oldest educational university in the world, had hospitals connected to medical schools in Iran, which date back to at least 1700 years ago.**

**Also, as you know, knowledge plays a very important role in Iranian culture; Especially after Islam, this land has been the cradle of great scientists, including mathematicians and physicists, philosophers and great physicians in the field of knowledge. For example, one of the most important of them was Avicenna, if you have been to the University of Paris, you will see his statue, under his name, he was called the prince of physicians. For example, the evidence of his importance in medicine is Avicenna's important book of medicine, namely the Canon of Medicine, which was taught in Western and Eastern universities until the 18th century. After going through this historical importance, the next issue is to pay attention to the scientific and cultural activity between countries, which is the root of peace and expansion of knowledge, coexistence and cooperation with each other and achieving peace and friendship between countries and different cultures of the world.**

**One of the important obstacles to achieving this peace is fruitless and usurping wars. For example, in the 21st century, unfortunately, one of the ugliest wars in the world has occurred in occupied Palestine. As you can see, the oppressed people of Gaza are being killed without food or shelter.**

**On the other hand, regarding Tehran University of Medical Sciences and its important role in the international field, I must explain that this university is one of the leading universities not only in the country but also in the region by attracting more than 1,900 international students from more than 50 countries. Also, we have a branch in Iraq, which has been working for more than a year. About 600 international students of the university, 500 of whom are studying medicine, are studying in this branch of the university called Sabatin in Karbala.**

**Also, in the case of medical education curricula, significant active and dynamic changes have occurred in the field of medicine; For example, artificial intelligence and manufacturing of medical devices have been added to the activities of this university. In the field of education and research, two activities have been added to our duties; One of them is equipment for students and currently we have more than 180 items of equipment in medicine such as neuro navigator and surgical robot and something related to cancer probe diagnosis cpd. Also, for the first time in the world, by one of the professors of Tehran University of Medical Sciences, buy invention of cancer probe diagnosis new machine for the first time in the world he has changed the creation of safe surgery for breast cancer with surgical technique and has made this cancer surgery easier to perform, and we are responsible for providing this service to add education and research in the university.**

**On the other hand, the expansion of health services in the creation of a health network and referral services for family doctors and health houses and control of hospitals are part of our duties that I don't have time to talk about its benefits and usefulness, but we are a social university that is at the level and the global distribution that is in front of us has a responsibility and we can provide these services in the best possible way. and learn from its experiences, and by collecting data and analyzing them, and based on these results, adjust our education and research system and in this way provide useful knowledge for the improvement of the society, which will be very valuable.**

**Fortunately, we implemented this model in Karbala and Iraq and implemented the pilot of this new special method, which is very important for the public health service.**

**In the final speech, I will mention the global strategic change. You look at the world, power is very important as an important component for any country and nation. A weak nation cannot resist and be stable in this situation, and therefore attention to achieve different aspect of the power is very important, and in this regard, the greatest indicator of power is knowledge.**
